

## UK government's global warming map

Just came across an interesting bit at Jean Marc Rommes' insightful [Long View](#) blog. He's spotted an interactive [global warming map](#) put out by the UK government and posts a troubling screen shot of expected global consequences with a 4 degree temperature rise and a summary of what the map program does.

In my recent [New York Under Water](#) series about the now-unstoppable 2-meter sea rise we can expect to see, that estimate is based on a conservative 2 degree temp rise. Things get a lot uglier the hotter the globe gets. See the Rommes links above for a quick look, and pointer to the UK site. Don't know about you but I love interactive maps, even if they play with scenarios of global disaster. Maybe especially then.
